

Health clinics including our senior health clinic

Identifying, preventing and early intervention when animals have disease is a key factor in trying to improve your pet's quality and longevity of life. Regular examination along with vaccination, regular worming and flea/tick control has shown to improve your pet's long term health.

We are always very happy to offer a full clinical examination to all patients of any age or breed via appointment consultation.

As well as offering health clinics to all our patients we have designed a focused health scheme for pets as they get **older**. This is designed to try and identify diseases like diabetes, heart disease, cancerous lumps or changes, liver/kidney failure, dental disease and other age related problems.

This involves an in depth questionnaire designed to highlight problems as well as a full clinical examination and full urine testing all for £29.99. Urine testing is a useful none invasive way of picking up problems. If any problems are highlighted there would be a further 10% off any blood testing carried out.

Please either contact the clinic on 01772 783327 for your questionnaire or download on the attachment below.

For further information of some of the age related diseases like diabetes please follow our links on the website on the right hand side under the title of dogs/cats.
